

Smart Hire Project – Select Your Preferred Module

Please vote for the module you prefer. Each member will handle both **Angular frontend** and **FastAPI backend** tasks for the selected module.

Option 1 – Authentication and User Management

Frontend:

Login, registration, user profile, provider profile, route guards, authentication interceptor and role-based navigation.

Backend:

JWT authentication, password hashing, user registration and login APIs, role validation, profile management and provider profile APIs.

Database tables:

users, provider_profiles

Best for someone interested in:

Authentication, security, user roles and profile management.

Option 2 – Services and Categories

Frontend:

Service category pages, service listing, search, filtering, service details, provider service creation and editing forms.

Backend:

Category APIs, service CRUD operations, image management, service areas, search, filtering and favorite services.

Database tables:

service_categories, services, service_images, service_areas, favorites

Best for someone interested in:

CRUD operations, search, filtering, forms and marketplace features.

Option 3 – Bookings and Notifications

Frontend:

Booking form, booking history, provider booking requests, booking status updates, availability management and notifications.

Backend:

Booking creation, booking lifecycle, accept or reject requests, availability APIs and notification management.

Database tables:

bookings, provider_availability, notifications

Best for someone interested in:

Business logic, date and time handling, workflows and real-time updates.

Option 4 – Reviews, Payments and Admin

Frontend:

Review and rating forms, payment status pages, admin dashboard, user management and system statistics.

Backend:

Review APIs, rating calculations, payment recording, payment status updates and admin management APIs.

Database tables:

reviews, payments

Best for someone interested in:

Dashboards, reporting, reviews, payments and administrative functions.

Option 5 – AI Features and Integration

Frontend:

AI assistant interface, service recommendation results, AI conversation history and review summary display.

Backend:

OpenAI API integration, AI conversation logging, service matching, recommendation logic, review summarization and embeddings.

Database tables:

`ai_conversations, ai_messages, review_summaries, service_embeddings`

Best for someone interested in:

Artificial intelligence, OpenAI API, recommendations, embeddings and prompt engineering.
